

AIWAZ

Star: Binary Vit/Gul

Known for: Aiwaz-mattor, The Eye of the Dancer temple, Debris Belt

Exports: Noble gases, harvested ship parts

Imports: -

Aiwaz is a binary star system with a unique sun. Due to chemical reactions in its core, the star shines with a greenish-white hue. Aiwaz B, also known as Rose, has a slightly pinkish star that is in the process of transforming into a red giant, which will engulf the first two planets in the system, Kenra and Hifamir, as it expands. However, this is not expected to happen within the next thousand years.

OVERVIEW AIWAZ-A

Vakomir: Rockplanet rich with metal ore, but burned by strong radiation.

Foss: Gas giant with a small debris ring.

Aiwaz: Habitable planet with several colony cities.

THE PLANET AIWAZ

Aiwaz is a planet that is far from the sun, but still lies within the habitable zone due to the special radiation of the energy-rich giant. The atmosphere of Aiwaz is highly charged with electromagnetic energy, but this does not pose a major problem for ships in the upper regions. However, as soon as ships descend to the lower regions of the planet, up to 4 kilometres above the

planet's regular zero point, the graviton projectors fail in almost all cases and the ships crash to the surface. Scientists suspect that the cause of this lies in the planet's core, which produces a particularly strong magnetic field. The effects on technology in general are similar on the planet. Hardly anyone in the lower regions of the planet uses it. Only at an altitude of 4 kilometres above the relative zero point does most technology function (mostly) without failure. For this reason, the more technologically advanced settlements of Montagnes and Haut Royaume are located on the only plateaus that rise at least 5 kilometres into the sky. This is also where the only safe landing sites for spacecraft on the planet are located.

The majority of the planet's surface consists of mountains and forested valleys, which are the result of heavy asteroid impacts in the planet's past, as well as large icy arctic regions in the north-west of the planet, measured along the axis of inclination. The weather conditions on the planet are usually light drizzle to cloudbursts, which occur throughout the entire cycle.

The inhabitants of this matriarchal world, who are skilled in 'clean' professions such as traders, scientists, priests, data genies or similar, live on the plateaus, while those with more dirty manual professions such as agriculture or livestock breeding are found in the valleys. Needless to say, this also means that on Aiwaz, most of the men live in the valleys, while the women reside on the plateau. Of course, husbands are also allowed to settle in the

upper regions, but they must travel to their workplaces via the magnetlift to the valley, unless they pursue a clean profession that is clearly dominated by women.

A special place on the planet is Aiwaz-Mattor, located on the edge of a crater lake several hundred kilometres in size. It is a palace that was the centre of power until the death of the ruler of Aiwaz, known as the 'Mother'. However, since the two daughters could not agree on the government of the settlements known as colonies, Aiwaz-Mattor is now only inhabited by the Hermetic Order of the Crescent Moon, which is also based there, the cult that initiated the worship of the Mother as a new icon several cycles ago. The quarrelling sisters have divided the two plateaus between themselves.

AIWAZ MATTOR

Aiwaz Mattor was not the first monument built on the planet, but it was the one that stood the test of time. During the long night, a ruling caste dominated by men quickly established itself on the planet from among the colonial governors. A good 100 years into the Age of Long Night, ongoing wars and strife led to upheaval on the planet when the population, which at that time was clearly female-dominated, instigated a revolution and established a matriarchy, whose ruling family chose Aiwaz Mattor as their official seat of government.

During and after the upheaval, the cult of the dancer also formed there from a group of sworn courtesans. Over time, however, this

gave rise to a new form of icon worship and belief that remained unnoticed by the Church for a long time and was already known as the 'Hermetic Order of the Crescent Moon' at the time when Zenith made contact with the colonies. It also inhabited the temple as a silent guard and memorial to the past misdeeds of men.

REMINDERS OF THE SECOND WAR

Today, the Aiwaz system is known for its tragic role during the Second Portal War. First the fleets of the Order of the Pariah clashed with the Legion's navy. Then the 3rd Horizon fought brutal battles against the forces of the 1st Horizon. What's left was hundreds of thousands casualties and hundreds of destroyed ships.

Scavengers soon began their work, harvesting the debris. The technology of the 1st Horizon was so alien and depended on the Darkness between the Stars, that it was stripped of recycleble materials, but was not adopted.

Today, forty years after the war, most of the debris has been cleared. The scavengers already began to leave the system.

THE FUTURE

While housing three portals, Aiwaz is nothing more than a stepping stone into the Sadaal Route. Few ships remain in the system, bringing the planet Aiwaz peace after nearly 50 years of conflict and scavanging.

OVERVIEW AIWAZ-B

Asteroid Belt A: Remains of a larger planetary body, destroyed by the star.

Kenra: Doomed planet with a small population.

Hifamir: Several small colonies on a habitable planet.

Rose: Gas Giant, rich in noble gases.

Polima: Dead rock.

Sador: Rumored to be home of a hermit colony.

Asteroid Belt B: Small asteroid belt.

ROSE

The institute has set up a research station in the orbit of the gas giant Rose, where two dozen employees are investigating the development of the star and its effects on the planets closest to it.

However, rumour has it that the institute is not alone in researching the development of the star. For that alone, a station in the orbit of the planets Kenra or Hifamir would be a far better option for at least the next 500 years. Rather, the institute is said to be more concerned with what is going on inside the gas giant Rose. If the reports sold to the Bulletin by an undercover reporter are to be believed, signals similar to those from Xene are being received from the depths of the gas giant.

Despite the long time frame until the expansion, the Council is endeavouring to resettle the few inhabitants of the two affected planets (Kenra and Hifamir), but this is meeting with aggressive armed resistance in some cases. The Colonial Office is currently considering establishing a 'solution' for the benefit of the inhabitants, while the Church of Icons is of the opinion that the settlers should be allowed to decide for themselves if and when

they want to leave their planet.
